

Make every drop count

Smart watering practices are something every grower understands. Crops depend on it; costs demand it. Our integrated controllers manage irrigation needs while maintaining the perfect growing climate.

FEATURES

- Independent, but integrated settings fine tune irrigation
 - elapsed time
 - accumulated light
 - accumulated Vapor Pressure Deficit (VPD)
 - Seed also considers soil moisture levels and offers the ability to disable unnecessary functions
- Set individual schedules for each valve
- Interface with fertigation injectors using a standard solenoid valve regulated through the control's irrigation program. The injector makes the decision for dose and the control manages the watering schedule
- Coordinate your available water pressure and volume to do more watering in the time available
- Be sure the benches that have waited longest for water are irrigated first

BENEFITS

- Increase profits by using water, fertilizer and other treatments efficiently
- Manage crop irrigation while maintaining the perfect growing environment
- Let your expert personnel have their hands and eyes on the crop, not a watering wand
- Better crop quality
- Decreased waste and associated costs

Trust Wadsworth to design beyond your expectations.
