

Lightning Protector

Excessive voltages from lightning strikes can cause damage to the communication ports on multiple controllers. The Lightning Protector diverts this voltage to ground, preventing system down time. Essential in greenhouses with controls located more than 25 feet apart, and in installations with multiple controls connected to a weather station.

FEATURES

The Lightning Protector is wired between the control and the network or the USB box and the network.

The Lightning Protector is simple to install because it comes prewired.

BENEFITS

- Protects communication lines against lightning strikes
- Ideal for expansive greenhouse range configurations
- Prewired for easy installation
- Safeguards your investment
- Greater reliability during inclement weather
